

## Survey Data Showing 298 Dogs Feeling "Very Good" or "Better Than Ever" on 1.1 mg/kg or less of DOCP (Percorten or Zycortal)

The standard dose of DOCP is 2.2 mg/kg. In the randomized controlled clinical trial from Michigan State University (MSU), they started dogs on 1.1 mg/kg from the very first dose. The study concluded that, "Low-dose DOCP protocols appear to be safe and effective for treatment of HA in most dogs. Standard-dose protocols are more likely to result in biochemical evidence of overtreatment."

For over 10 years & with more than 10,000 dogs now in CARE, our anecdotal experience has reflected this data. Additionally, our survey results support MSU's findings. It is important to note that the majority of respondents indicated they were still in the process of reducing the dose. In our experience, most dogs feel their best at doses significantly less than 1.1 mg/kg. This approach should never be attempted without working with your veterinarian & carefully testing the electrolytes.

See more information on Pages 10 & 11 & participate in the group to learn more.

See the MSU study here: <https://onlinelibrary.wiley.com/doi/10.1111/jvim.16195>

Source: Canine Addison's Resources & Education (CARE) Survey of Doses & Owner Reported Outcomes

As mentioned in the MSU study, dogs do not feel their best when overtreated with Percorten or Zycortal. Although the financial savings from reducing are a benefit, the main reason for reducing is to help our dogs feel their very best.

According to MSU, the 1.1 mg/kg dose can be given from the start, even for dogs in crisis. When moving to the low-dose starting amount, it is recommended to test the electrolytes at 10-14 days after the first low-dose injection & again by Day 28. Injection day counts as Day 0.

(Continued on next page)

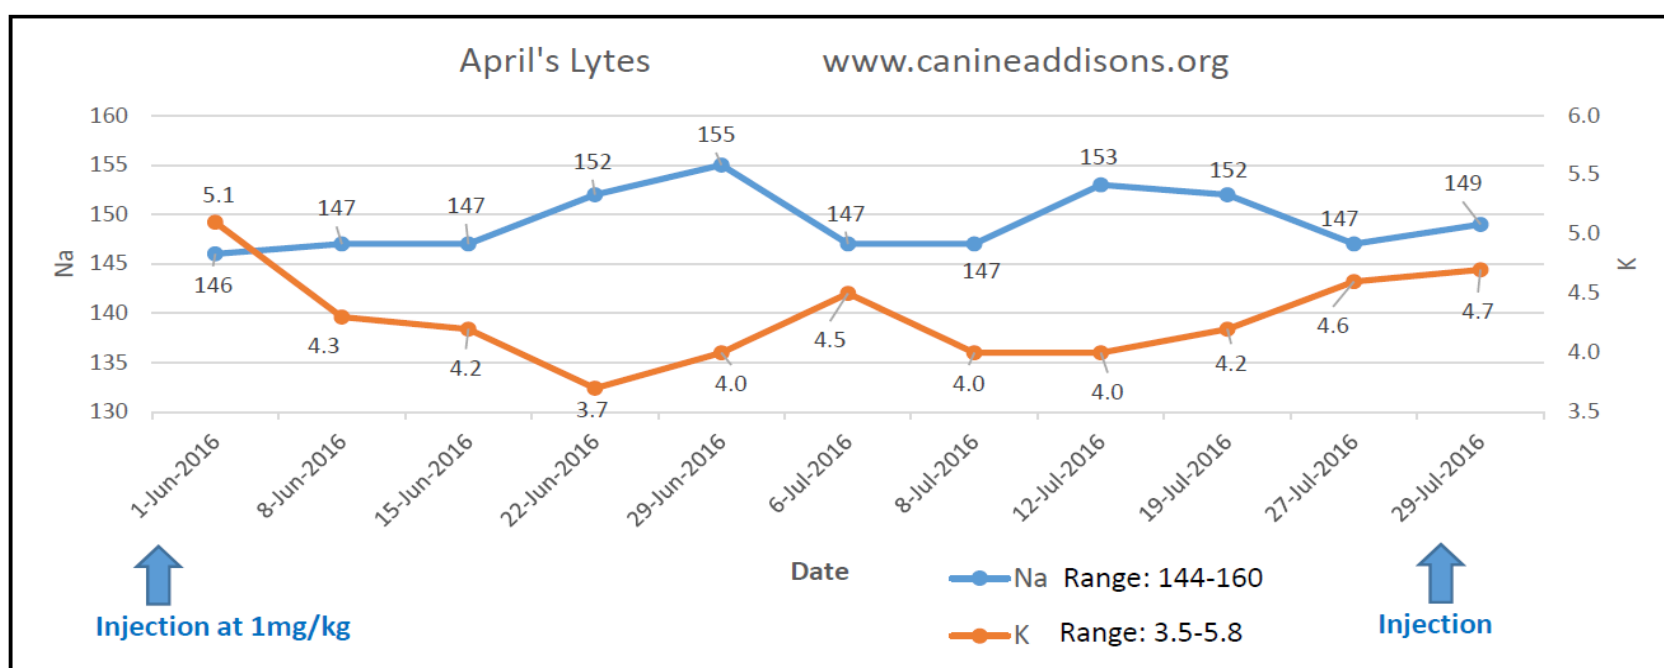

## Survey Data Showing 298 Addison's Dogs Feeling "Very Good" or "Better Than Ever" on 1.1 mg/kg or less of DOCP (Percorten or Zycortal) - Sorted by mg/kg

If you want to follow the low-dose approach with your veterinarian, it is critical that you are able to follow up on testing the electrolytes & giving the injection in a timely fashion when it is needed. If circumstances might get in the way of doing so, the low-dose approach would not be recommended. Wait until a time when things are more manageable.

To avoid hypokalemia (low potassium), we find great benefit in waiting for the excess DOCP to wear off before giving the next injection. Typically, that means waiting for the potassium to get up to mid-range before giving the next injection. This is done through careful testing of the electrolytes. We have seen previous doses continue to control the electrolytes for up to several months after a long series of overtreatment (although we don't recommend waiting that long). If we don't allow the excess to wear off (through a process of carefully studying the electrolytes), we cannot be sure whether the new low-dose is sufficiently controlling the electrolytes or if the excess from previous doses is still at work. Our goal is to carefully reduce the dose in order to achieve a stable dose that keeps the electrolytes well-controlled in the middle of the reference ranges for a 28-30 day cycle. Extending the cycle is definitely not the goal. Reducing the dose should never be done on your own, without your veterinarian involved, or without testing the electrolytes in a careful manner.

The process of reducing in this way can be difficult to grasp & cannot be sufficiently explained in this document. We recommend you speak with your veterinarian. Ask questions in the group & we can provide information to discuss with your veterinarian so you can have a more informed conversation about reducing.

The DOCP injection forms a microcrystalline depot which continues to release medication over time. The sodium & potassium go up & down during the cycle & as mentioned, it can continue to work for an extended period. This graph shows a dog named April who was started on 1 mg/kg & waited 2 months to give the next injection before eventually achieving her optimal dose, which is given every 28 days. April's veterinarian wrote a case study about this process.

Thank you to Nicole K. in Australia for providing April's data for this graph. April was previously on Florinef. She started Percorten at 1mg/kg. It took nearly 2 months for her to be ready for her 2nd injection. April needed many reductions to get to her optimal dose.

In our interview with him, Dr. Langlois talked about how one of the original Canine Addison's researchers back in the 1980s, Dr. William Shaw, "...used to walk around our clinic floor and his dosing schematic for DOCP was a half a mil for little dogs and one mil for big dogs." MSU had been using low-dose DOCP for many years prior to the release of this study. Please view our interview with Dr. Daniel Langlois, the author of MSU's low-dose DOCP study, here:

## Survey Data Showing 298 Addison's Dogs Feeling "Very Good" or "Better Than Ever" on 1.1 mg/kg or less of DOCP (Percorten or Zycortal) - Sorted by mg/kg

Remember that all treatment decisions need to be made in partnership with your veterinarian. This data is for information only in the hope that it will help you become a more informed participant in your dog's treatment, as guided by your veterinarian. Our group members have worked with many veterinarians who are delighted to learn new approaches guided by peer-reviewed, published research studies. Check our website for this & other low-dose DOCP studies.
