# Survey Data Showing 283 Addison's Dogs Feeling "Very Good" or "Better Than Ever" on 0.02 to 0.04 mg/kg of Pred (or less)

Please note: Doses are always individualized to the needs of each dog. There is not a one size fits all dose of any medication for Addison's. Although we find that the great majority of dogs do extremely well on a range of 0.02 to 0.04 mg/kg of Pred, there will occasionally be dogs who need more than this amount & that is okay. The goal is to work with your veterinarian to safely wean down to the dose that keeps your dog feeling their best with no signs of deficiency or excess. It's better to err on the side of giving a little too much rather than not enough. Adjusting doses should always be done in partnership with your veterinarian. In viewing the survey results, it is important to note that the majority of respondents indicated they were still in the process of reducing the dose.

Legend:
- 0.01 mg/kg
- 0.02 mg/kg
- 0.03 mg/kg
- 0.04 mg/kg

Chart segments:
- 26 dogs, 0.01 mg/kg, 9%
- 76 dogs, 0.02 mg/kg, 27%
- 96 dogs, 0.03 mg/kg, 34%
- 85 dogs, 0.04 mg/kg, 30%

Approximate Examples:

0.02 mg/kg = 0.9 mg for a 100 pound/45 kg dog

0.03 mg/kg = 1.4 mg for a 100 pound/45 kg dog

0.04 mg/kg = 1.8 mg for a 100 pound/45 kg dog

Source: Canine Addison's Resources & Education (CARE) Survey of Doses & Owner Reported Outcomes

Pred needs to be given **daily** for dogs with Addison's disease (unless they are on fludrocortisone acetate).

Common signs of too little Pred (or of needing a one-time boost for stress) include, but are not limited to, vomiting, diarrhea, lethargy, or lack of appetite.

In most cases, boosts for stress are rarely needed. When needed, boosts are usually given in half the daily dose when your dog is down to their maintenance dose. If the dose is still high, you should not need to boost.

Speak with your veterinarian about the amount of boost needed for surgery or medical procedures. See our surgery file, here:

https://canineaddisons.org/wp-content/uploads/2019/03/CARE-Surgery-for-Dogs-with-Addisons-Disease-1.pdf

Pred replaces the cortisol their bodies can no longer produce and helps them deal with stress. It does many other important things as well. Please see this article, which explains the important role cortisol plays. Although it helps with stress, Pred does not calm them.

https://www.sandiaanimalclinic.com/2020/12/01/the-importance-of-cortisol-in-dogs-and-cats/

Survey Data Showing Addison's Dogs Feeling "Very Good" or "Better Than Ever" on 0.02 to 0.04 mg/kg of Pred (or less)

There are many possible signs of too much Pred. They include things like excess hunger, drinking, urinating, & panting but they can also include lack of appetite, which may seem counterintuitive. See our broad listing, here:

https://canineaddisons.org/wp-content/uploads/2019/07/CARE-Signs-of-Too-Much-Pred.pdf

In the document in the link above, you'll see endrocrinologist Dr. Mark Peterson say he would rarely, if ever, give more than 5 milligrams of Pred to any dog for Addison's. When dogs are first sent home from the hospital after an Addisonian crisis, their doses are usually much higher than their eventual maintenance dose. However, if it is much higher than 5 to 10 milligrams, you might want to share this document with your veterinarian & inquire about the dosing strategy. It's possible the high dose could be for something other than Addison's, such as low glucose or anemia. If the high dose was intended only for Addison's & you are seeing some of the side-effects listed, it is okay to call your veterinarian & ask about reducing the dose to remediate the side-effects. Adjusting doses should not be done without consulting your veterinarian.
